

Abstract

Ajax, JSON, Angular, Bootstrap, MongoDB, RWD, Node.js, and the FinnHub Stock API

Assignment 3: Ajax, JSON, Responsive Design and Node.js

Stock Search (AJAX/JSON/HTML5/

Bootstrap/Angular /Node.js/Cloud Exercise)

1. Objectives

- Get familiar with the AJAX and JSON technologies
- Use a combination of HTML5, Bootstrap and Angular on client side
- Use Node.js on server side
- Get familiar with Bootstrap to enhance the user experience using responsive design
- Get hands-on experience of Cloud services hosting NodeJS/Express
- Learn to use popular APIs such as the Finnhub API, Polygon.io API and Highcharts API
- Learn how to manage and access a NoSQL DBMS like MongoDB Atlas, in the cloud

2. Background

2.1.AJAX and JSON

AJAX (Asynchronous JavaScript + XML) incorporates several technologies

- Standards-based presentation using CSS
- Result display and interaction using the Document Object Model (DOM)
- Data interchange and manipulation using XML and JSON
- Asynchronous data retrieval using XMLHttpRequest
- JavaScript binding everything

together See the class slides on D2L

Brightspace.

JSON, short for JavaScript Object Notation, is a lightweight data interchange format. Its main application is in AJAX web application programming, where it serves as an alternative to the use of the XML format for data exchange between client and server. See the class slides on D2L Brightspace.

2.2.Bootstrap

Bootstrap is a free collection of tools for creating responsive websites and web applications. It contains HTML and CSS-based design templates for typography, forms, buttons, navigation, and other interface components, as well as optional JavaScript extensions. To learn more details about Bootstrap please refer to the lecture material on Responsive Web Design (RWD). We recommend using Bootstrap 5.3.2, Angular 17, and ng-bootstrap16.x.x in this assignment. See the RWD class slides on D2L Brightspace for the list of dependencies between these various versions.

2.3.Cloud Services

2.3.1.Google App Engine (GAE)

Google App Engine applications are easy to create, easy to maintain, and easy to scale as your traffic and data storage needs change. With App Engine, there are no servers to maintain. You simply upload your application and it's ready to go. App Engine applications automatically scale based on incoming traffic. Load balancing, microservices, authorization, SQL and NoSQL databases, memcache, traffic splitting, logging, search, versioning, roll out and rollbacks, and security scanning are all supported natively and are highly customizable.

To learn more about GAE support for Node.js visit this page: https://cloud.google.com/

appengine/docs/standard/nodejs/

2.3.2.Amazon Web Services (AWS)

AWS is Amazon's implementation of cloud computing. Included in AWS is Amazon Elastic Compute Cloud (EC2), which delivers scalable, pay-as-you-go compute capacity in the cloud, and AWS Elastic Beanstalk, an even easier way to quickly deploy and manage applications in the AWS cloud. You simply upload your application, and Elastic Beanstalk automatically handles the deployment details of capacity provisioning, load balancing, auto-scaling, and application health monitoring. Elastic Beanstalk is built using familiar software stacks such as the Apache HTTP Server, PHP, and Python, Passenger for Ruby, IIS for .NET, and Apache Tomcat for Java.

To learn more about AWS support for Node.js visit this page: https://

aws.amazon.com/getting-started/projects/deploy-nodejs-web-app/

2.3.3.Microsoft Azure

Microsoft Azure is a cloud computing service created by Microsoft for building, testing, deploying, and managing applications and services through a global network of Microsoft-managed data centers. It provides software as a service (SaaS), platform as a service (PaaS) and infrastructure as a service (IaaS) and supports many different programming languages, tools, and frameworks, including both Microsoft-specific and third-party software and systems.

To learn more about Azure support for Node.js visit this page: https://

docs.microsoft.com/en-us/javascript/azure/?view=azure-node-latest

2.4.Angular

Angular is a toolset for building the framework most suited to your application development. It is fully extensible and works well with other libraries. Every feature can be modified or replaced to suit your unique development workflow and feature needs. Angular combines declarative templates, dependency injection, end-to-end tooling, and integrated best practices to solve development challenges. Angular empowers developers to build applications that live on the web, mobile, or the desktop.

For this homework, <u>Angular 17+ can be used</u>, but <u>Angular 17 is recommended</u>. To learn more about Angular, visit this page:

https://angular.io/

2.5.Node.js version 20

Node.js is a JavaScript runtime built on Chrome's V8 JavaScript engine. Node.js uses an event-driven, non-blocking I/O model that makes it lightweight and efficient. Node.js package ecosystem, **npm**, is the largest ecosystem of open-source libraries in the world.

To learn more about Node.js, visit:

https://Node.js.org/en/

Also, Express.js is strongly recommended. Express.js is a minimal and flexible Node.js web application framework that provides a robust set of features for web and mobile applications. It is in fact the standard server framework for Node.js.

To learn more about Express.js, visit:

http://expressjs.com/

Important Note: All APIs calls should be done through your Node.js server

3. High-Level Description

In this exercise you will create a webpage that allows users to search for stocks using the Finnhub API and display the results on the search page. The application evolves from the previous homework.

A user will first open a page as shown below in **Figure 1**, where the user can enter a stock ticker symbol and select from a list of matching stock symbols using "autocomplete." A quote on a matched stock symbol can be performed. The description of the Search Box is given in **Section 3.1**. Instructions on how to use the API are given in **Section 4**. All implementation details and requirements will be explained in the following sections.

There are 4 routes for this application:

- a) Home Route ['/'] redirected to ['/search/home']- It is the default route of this application.
- b) Search Details Route ['/search/<ticker>'] It shows the details of the <ticker> searched
- c) Watchlist Route ['/watchlist'] It displays the watchlist of the user.
- d) Portfolio Route ['/portfolio'] It displays the portfolio of the user.

When a user initially opens your web page, the initial search page should look like in Figure 1.

Stock Search		Search Wa	tchlist Portfolio
	STOCK SEARCH		
	Enter stock ticker symbol Q X		

3.1.Search Page / Homepage

3.1.1.Design

You must replicate the Search Bar displayed in Figure 1 using a Bootstrap form. The Search Bar contains three components.

- 1. Stock Ticker: This is a text box, which enables the user to search for valid stocks by entering keywords and/or accepting a suggestion of all possible tickers. Notice the "helper" text inside the search box.
- 2. Search Button: The "Search" button (which uses the widely used search icon), when clicked, will read the value from the textbox and send the request to the backend server. On a successful response, details for that stock will be displayed.
- 3. Clear button: The 'clear' (cross marked) button, would clear out the currently searched results page and show the initial search page.

3.1.2.Search Execution

Search can be executed in the following ways:

- 1. Once the user enters a ticker symbol and directly presses the Return key or clicks on the "Search" button, without using the auto-complete suggestion, your application should make an HTTP call to the Node.js script hosted on GA/AWS/ Azure back end (the Cloud Services). The Node.js script on Cloud Services will then make a request to the Finnhub API services to get the detailed information. If the entered ticker is invalid and no data is found, an appropriate error message should be displayed. If valid stock data is found, the search results should be loaded.
- 2. Once the user starts typing a ticker symbol, autocomplete suggestions (See Section 3.1.3 below) will populate below the search bar. A matched ticker can be selected. Upon clicking the dropdown selection, the search should start automatically, and execute identically as described in the previous paragraph.

3.1.3.Autocomplete

A Search Bar allows a user to enter a keyword (Stock ticker symbol) to retrieve information. Based on the user input, the text box should display a list of all the matching company's ticker symbols with the company's name (see Figure 2). The autocomplete JSON data is retrieved from the *Finnhub Search API* (refer to Section 4.1.4).

The autocomplete response is filtered using the criteria: type= 'Common Stock', Symbol doesn't contain '.'(dot)

These are examples of calling this API:

The autocomplete function should be implemented using **Angular Material**. Refer to Section 5.3 for more details.

	Powered by <u>Finnhub.io</u>	

Figure 2: Autocomplete Suggestion

3.2.Search Results Page

3.2.1.Details of Searched Stock

After the user executes a search for a ticker, a page should route to /search/<ticker> path (example: /search/AMZN). The following components need to be displayed on successful search:

- Symbol, company name, trading Exchange (such as NASDAQ), and a Buy button on top left, The Sell button should appear alongside the Buy button only when the portfolio has purchased stocks of a company. See Figure 3.3;
- Last price, change, percent change, and date/time, on top right. The change items should be preceded by appropriately colored arrows;
- Company Logo and Indication of open / closed market in the top-center;
- Summary, Top News, Charts and Insights tabs.

IMPORTANT NOTE: If the user navigates to the watchlist route or the portfolio route, and navigates back to the search results page, the previously searched stock results

should remain on

the search/<ticker> route. Also, results data should be retrieved from a state/service and not be fetched from a new search API call.

Figure 3.2: Search Details page overview (Market is Open)

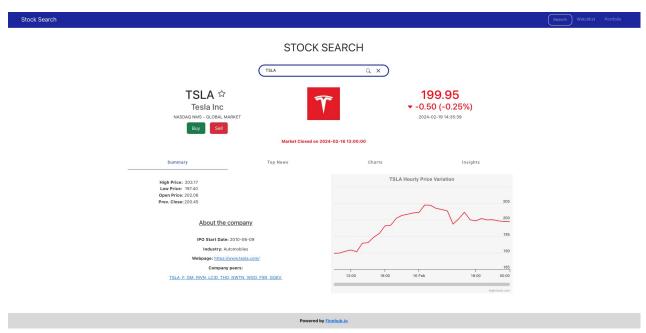

Figure 3.3: Search Details page overview (Dynamic Sell button when the portfolio has purchased stock of the company)

- When the user clicks on the star icon, the white star turns yellow, and that ticker should be stored in MongoDB Atlas. A self-closing alert should be displayed at the top and that stock should be visible on the Watchlist Page (see Section 3.3).
- When the user clicks on the **Buy** button, a modal window should open. which will display the details (stock symbol, current price, money in wallet, input for quantity of shares to buy and total price for the shares), as shown in Figure 3.5. Note that:
 - The Buy button should be disabled if the user inputs a quantity < 1 or the quantity field is empty or the quantity leading to total more than money in wallet (see Figure 3.5);
 - The **Buy** button will be enabled once the user enters a number greater than 0 and suitable quantity up to total equals (or less than) money in the wallet (see **Figure 3.4**).
- The Sell option is available on the homepage only when there is at least 1 quantity of stock available in the portfolio. Upon clicking the Sell button, similar behavior as the buy transaction should be implemented, along with the constraint being able to sell only the stocks owned.
- Error messages should be shown for an attempt to buy more than the possible quantity of stocks using the money in wallet/attempt to sell more than the number of stocks owned in Portfolio. See Figure 3.5 for reference.
- A self-closing transaction alert message should be shown for both buy and sell transactions as in Figure 3.4a.

Figure 3.5: Buy button disabled for invalid input

For details and screenshots of similar sell transactions, refer to Section **3.4** (Portfolio). As described, the page contains two major panels:

1) Stock Details: This panel displays all the values mentioned in Table 3.1. Last Timestamp should be only displayed beside the Market status if "Market is Close."

Fields	Sample Values	API reference
Ticker	VMW	From table 4.1, use 'ticker' key
Company's Name	VMware Inc.	From table 4.1, use 'name' key
Exchange Code	New York Stock Exchange, Inc	From table 4.1, use 'exchange' key
Last Price	126.99	From table 4.3, use 'c' key
Change	1.09	From table 4.3, use 'd' key
Change Percentage	0.86%	From table 4.3, use 'dp' key
Current Timestamp	2022-02-17 09:02:21	From table 4.3, use 't' key
Market Status	Open/Close	Calculation from timestamp

Table 3.1 – Stock Details

2) Material Tabs – This component helps users see different stock data on the same page, and the content of the tabs is detailed in the following sections.

IMPORTANT NOTE: All numerical values should be rounded off to 2 decimal places.

Data mentioned in the Stock Details section and Summary Tab, should auto-update every 15 seconds, when the stock market is open.

3.2.2.Summary Tab

This tab contains a summary of the stock, which includes:

- Details, as follows:
 - Calculate if the market is open, using the timestamp key in Table
 3.2. The value of 't' is the last timestamp at which the stock details are available. Assume the market is closed if more than 5 minutes has elapsed from this 't' value. Assume the market is open, if otherwise.
 - If the market is open: display all the fields mentioned in Table 3.2 and Table 3.3, as shown in Figure 3.2.
 - If the market is closed: Display all the fields mentioned in Table 3.2 and Table 3.3, as shown in Figure 3.1.
- About the Company: values from Table 3.3.
- Chart for the last Working Day:
 - See Section 4.1.2 to obtain hourly stock price data using resolution '5' and show variation for the last 6 hours.
 - If the market is open: show stock price variation from current time.
 - If the market is closed: show stock price variation from when the market was closed. (i.e., last working day).

Fields	Sample Values	API reference
High Price	128	From table 4.3, use 'h' key
Low Price	124.90	From table 4.3, use 'l' key
Open Price	125	From table 4.3, use 'o' key
Prev. Close	125.90	From table 4.3, use 'pc' key
Timestamp	1645218002	From table 4.3, use 't' key

 Table 3.2: Fields used inside Summary Tab (Part 1)

Fields	Sample Values	API reference
IPO Start Date	2007-08-14	From table 4.1, use 'ipo' key

Industry	Technology	From table 4.1, use 'finnhubIndustry' key
Webpage	https://www.vmware.com/	From table 4.1, use 'weburl' key
Company Peers	MSFT, ORCL, NOW, VMW	From table 4.8, use response list

Table 3.3: Fields used inside Summary Tab (Part 2)

Important Note: The list of company peers should be clickable links which should navigate to the search results of that ticker.

3.2.3. Top News Tab

This tab shows top news for the given stock ticker symbol (see Figure 3.6 and Figure 3.7). In particular:

- Show cards which contain Image and Title.
 - For Image use 'image' key from Table 4.5.
 - For Title use 'title' key from Table 4.5.
- When clicking on a card, open a Modal window as shown in Figure 3.7. For details regarding Modal check Section 5.3. Modal contains all the fields mentioned in Table 3.4.
- Users can share the news articles on Twitter and Facebook. For details on how to use it, check Section 4.2. Twitter and Facebook should open in a new browser tab, if clicked.
 - In Twitter, it should create a post having following content:
 - Title of the news article
 - URL of the news article.
 - In Facebook, it should create a post, which contains the URL of the news Article.
- Inside modal, when the user clicks on '*here*' in '*For more details click here*', it should open the URL for the article in a new browser tab.

Fields	API reference
Source	From Table 4.5, use 'source' key.
Published Date	From Table 4.5, use 'datetime' key.
Title	From Table 4.5, use 'headline' key.
Description	From Table 4.5, use 'summary' key.
URL	From Table 4.5, use 'url' key.

 Table 3.4: Fields used inside modal of Top News Tab

Figure 3.7: Top News Detailed Modal overview.

3.2.4. Charts Tab

This tab uses HighCharts to display historical stock market data on the related stock. In particular:

- See Figure 3.8 for reference using Section 4.1.3 implementation.
- For more details regarding *Highcharts* see Section 5.5.
- Display SMA and Volume by Price charts for data of the last 2 years.

Figure 3.8: Charts tab overview.

3.2.5. Insights Tab

This tab uses a table that contains fields as mentioned in Table 3.5 and HighCharts to display recommendation trends and company earnings data on the related stock. In particular:

- See Figure 3.9 for reference using Section 4.1.7 and Section 4.1.9.
- Aggregate the response data from Section 4.1.7 for all MSPR data and display it in the table.
- For more details regarding Highcharts see Section 5.5.

Fields	API reference
Total - MSPR	From Table 4.7, aggregate the values of the 'mspr' key.
Positive – MSPR	From Table 4.7, aggregate all positive values of the 'mspr' key.
Negative – MSPR	From Table 4.7, From Table 4.7, aggregate all negative values of the 'mspr' key.

Total – Change	From Table 4.7, aggregate the values of the 'change' key.
Positive – Change	From Table 4.7, aggregate all positive values of the 'change' key.
Negative – Change	From Table 4.7, From Table 4.7, aggregate all negative values of the 'change' key.

Table 3.5: Fields used inside table of Insights Tab

IMPORTANT NOTE: 'Total' calculation to be made appropriately for all fields from the array of response obtained (see Section 4.1.7).

Figure 3.9: Insights tab overview.

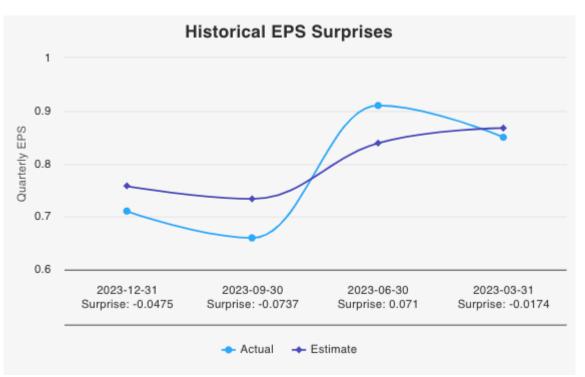

Figure 3.9a: Company Earning chart with non-null values

IMPORTANT NOTE: Display an error message, as shown below, if the user did not enter any input in the search box or no data is found for the entered input. Use the company profile response to determine no data.

Figure 3.10: Error Alert.

3.3.Watchlist Menu

This menu will display all the stocks that are added to the watchlist by the user. This watchlist will be maintained in *MongoDB Atlas*. For more details on MongoDB Atlas, see section 5.4 and Figure 3.11.

- If the change is positive, the color of the 'c', 'd' and 'dp' keys should be green
- If the change is negative, the color of the 'c', 'd' and 'dp' keys should be red
- If there is no change, the color of the 'c', 'd' and 'dp' keys should be black.
- When clicking on the close button on the right-top corner of the card (the "x"), it should remove the stock from the watchlist and display an updated watchlist.
- When clicking on the card, it should open the details route of that ticker (stock).
- If the watchlist is empty, it should display the alert as shown in Figure

3.12. 'c', 'd' and 'dp' key should be used from Table 4.3.

NOTE: 'percentage change' should be rounded off to 2 decimal places.

Upon clicking any area of the watchlist card, the user should be navigated to the search details page of that stock. Initially a loading "spinner" is displayed until the watchlist is pulled from the database.

My Watchlist

× GOOGL Alphabet Inc	140.52 ▼ -2.25 (-1.58%)	
× MSFT Microsoft Corp	404.06 • -2.50 (-0.61%)	

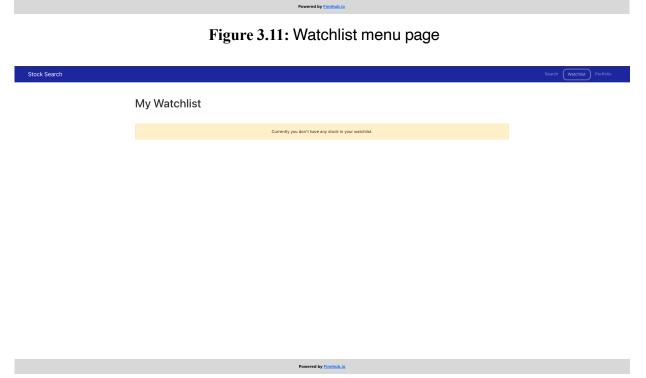

Figure 3.12: Watchlist Empty Alert

3.4.Portfolio Menu

This menu will display all the stocks that have been bought by the user (i.e., the current portfolio of the user). This portfolio will be maintained in the *MongoDB Atlas*. For more details on MongoDB Atlas, see Section 5.4 and Figure 3.13.

To simulate real-world stock trading and allow the user to incur profits/losses, a wallet feature should be implemented. Initialize the cash balance in the wallet to be \$25,000.00 using MongoDB Atlas. Users will use this cash balance to trade stocks.

Update the money spent and gained during buy and sell transactions, accordingly. The initial price of stock when buying it, and the current change in price should be used to update the balance in the wallet for profit and loss. Initially a loading spinner is displayed until the portfolio is pulled from the database.

In particular:

- If the current rate is greater than the rate at which user bought it, then color of the 'Change', 'Current Price' and 'Current Total' keys should be green;
- If the change is negative, the color of the 'Change', 'Current Price' and 'Current Total' keys should be red;
- If there is no change, the color of the 'Change', 'Current Price' and 'Current Total' keys should be black;
- When clicking on the Buy button, a modal should open as shown in Figure 3.15. The Buy button inside the modal should be disabled if the quantity entered by the user is not valid, as shown in Figure 3.14. Valid input should be (a) greater than 0, with (b) quantity that produces a total less than available cash in the wallet and (c) must be non-empty;
- When clicking on the Sell button, a modal should open as shown in Figure 3.17 and 3.18. The Sell button inside the modal should be disabled if the quantity entered by the user is not valid. Input is Valid if, 0<input<=Quantity and must be non-empty. Quantity is described in Table 3.6;
- When clicked on card's header part, it should open the search details route of that ticker (stock);
- If the portfolio is empty, it should display the alert as shown in Figure 3.14.

'c' key should be used from Table 4.3 for 'Current Price'. 'Current Change' and 'Current Total' should be calculated as shown in Table 3.5.

Quantity	Total Number of stocks bought by the user. It Should be more than 0, otherwise remove it from the portfolio in MongoDB Atlas.
----------	---

Total Cost	Total cost is the sum of the total cost paid for all the purchases of the stock. For Example, if user has bought 10 stocks of AAPL in past, at the rate of 200, and today if user buys another 10 stocks of AAPL at the current price, i.e. 300, then the Total Cost for the user will be (10*200) + (10*300) = 5000. So Quantity is 20 and Total Amount is 5000.
Average Cost per Share	(Total Cost / Quantity)

Current Price	'c' key from the table 4.3
Change	(Average Cost per Share – Current Price) of the stock. Here, Current Price is 'c' key from the table 4.3
Market Value	(Current Price * Qty), here Current Price is 'c' key from Table 4.3 and Qty is the number of stocks present in the user's portfolio.

Table 3.6: Fields used in Portfolio Cards.

Alerts should be displayed for successful buy and sell transactions, which should auto-close.

About the company	Powered by <u>Fin</u>	nhub.io	Powered by <u>Fin</u>	nhub.io

You must watch the video carefully to see how the page looks on mobile devices. All functions must work on mobile devices.

One easy way to test for mobile devices is to use Google Chrome Responsive Design Mode and Safari Develop – User Agent menu. An iPhone 12 Pro is used in the video.

5. Navbar

The Navigation bar must be present on top of the page, and visible at all times, as shown in all the figures above. You can use Bootstrap to create a navbar. It consists of following menu options:

- 1. Search
- 2. Watchlist
- 3. Portfolio

6. Footer

The Footer must be present at the end of each page, as shown in above figures. It should contain following line:

"Powered by Finnhub.io"

4. API's description

4.1.Finnhub API calls, similar to Assignment 2

In this assignment, we will use the Finnhub API. A comprehensive reference about this API is available at:

https://finnhub.io/docs/api/introduction

4.1.1.Company's Description

Reference: https://finnhub.io/docs/api/company-profile2

For Company's Description, use the following API. For more details refer Figure 4.1:

https://finnhub.io/api/v1/stock/profile2?symbol=<TICKER>&token=<API_Key>

URL parameter in API Call:

- Ticker: Ticker symbol of the stock. E.g.: MSFT
- Token: The API access Token. It is private, please do not share with anyone. See Assignment 2.

Response Keys	Details
country	Country Name
currency	Currency Symbol
exchange	Company's Exchange
name	Company's Name
ticker	Company's Symbol
іро	Company's Start Date
marketCapitalization	Company's MarketCap
shareOutstanding	Company's Shares
logo	Company's Logo
phone	Company's Contact No.
weburl	Company's Website Url
finnhubIndustry	Company's Industry

An example URL constructed from the parameters will look like this:

https://finnhub.io/api/v1/stock/profile2?symbol=AAPL&token=<API_Key>

Response:

14	3

Figure 4.1: Response received for Company's Description API call

4.1.2. Company's Historical Data

You should extract the content of Time Series Data from the returned JSON object to construct a chart which is responsible for displaying (close) price and volume. The chart is provided by **HighCharts**. Find more information about HighCharts at:

https://www.highcharts.com/demo https://

www.highcharts.com/demo/stock/area https://

www.highcharts.com/demo/stock/candlestick-and-volume

The historical data for the ticker can be obtained from Polygon.io "Aggregate (Bars)"

Service. Please refer to the API documentation at:

https://polyg	gon.io/docs/stocks/get	v2_aggs_	ticker	stocksticker	range
multiplier	timespa n		from	to	-

for more details on the Service.

API Sample:

GET: /v2/aggs/ticker/{stocksTicker}/range/{multiplier}/{timespan}/{from}/{to}

https://api.polygon.io/v2/aggs/ticker/AAPL/range/1/day/2023-01-09/2023-07-09?adjusted=true& sort=asc&apiKey=ctO8iVF_Gi19afBovU1ZSr6UIxqt8Fr3

When constructing the HTTP request required to obtain the Company Stock Chart, you need to provide 6 values:

- 1. The first value, the stockTicker the user entered in the form.
- 2. The second value, the multiplier, is the size of the timespan multiplier. Should be a 1.
- 3. The third value, the timespan, should be day.
- 4. The fourth value, the **from** date, is the start of the aggregate time window. Either a date with the format YYYY-MM-DD or a millisecond timestamp. This should be **6 months and 1 day** prior to the current date. You can use Python DateUtils's "relativedelta" to calculate the date. Please refer to <u>https://dateutil.readthedocs.io/en/stable/relativedelta.html</u> for more details.
- 5. The fifth value, to, is the end of the aggregate time window. Either a date with the format YYYY-MM-DD or a millisecond timestamp. It should be the current date (Today's date).
- 6. The sixth value, the query string, should contain "adjusted=true&sort=asc&apiKey=YOUR_KEY", where the apiKey is your Api Key that you created. Do <u>not</u> use the limit parameter, as it will conflict with the from/to dates. Limit will default to 5,000, which is enough for 6 months of data.

Note: The Service only accepts dates in UNIX timestamps so you will need to convert dates to UNIX epoch time.

The response of this HTTP request is a JSON-formatted object. Figure 4.2 shows a sample response from the request. You need to parse this JSON object and extract some fields as required.

```
{
    "c": 75.0875,
    "h": 75.15,
    "l": 73.7975,
    "n": 1,
    "o": 74.06,
    "t": 1577941200000,
    "v": 135647456,
    "vw": 74.6099
},
```

Figure 4.2: Sample JSON response from Polygon.io API's Aggregate (Bars) Endpoint

The data obtained from the API can then be mapped to the HighCharts dataset using the mapping below.

Chart Data	Data from polygon.io Aggregate (Bars) service JSON response	
Date	The value of key "t". The time stamp is given in the Unix epoch time.	
Stock Price	The value of key "c"	
Volume	The value of key "v"	

Table 4.1: Mapping JSON data and HighCharts data

Note: Map each returned array element for each attribute, by its index. For example, for date (timestamp) t[0], close price is c[0] and volume is v[0].

For mapping the Stock price data to data for HighCharts, create an array of data points (x1, y1) where x1 will be the date and y1 will be the corresponding close stock price for that day. This array will then act as an input dataset for your HighCharts. Please refer to links in Assignment 2 for more details.

Similarly create another array of points (x2, y2) where x2 will be the date and y1 will be the volume for that day. This array will be the second input for your HighCharts. Since you will be plotting Stock Price vs Date and Volume vs Date you will have two different datasets and two y-axis and a single x-axis.

Initially, the chart shows the historical stock price (in blue line with filling the area below, two digits after decimal) and volume (in gray bar) for the **past six months** by an interval of **one day**. Figure 4.3 shows an example of the Stock Price/Volume chart.

Figure 4.3: An Example of Chart showing Stock Price/Volume for 6 months

The title of the chart for showing price/volume is "Stock Price <Ticker> (YYYY-MM-DD)", where "YYYY-MM-DD" is today's date. The subtitle of the chart should be "Source: Polygon.io" and should hyperlink to the Polygon.io website: <u>https://polygon.io/</u>. The title of the Y-axis is "Stock Price" when showing the stock price and the other Y-axis is "Volume".

The X-axis changes on the basis of the zoom level 6 months, 3 months, 1 month, 15 days, and 7 days. Please refer to Section 3 for references on how to change the chart data on the basis of the zoom level. Figure 4.4 shows an example of the Stock Price/Volume chart for 15 days zoom level. Ensure that the volume bars are small enough to not overlap the quote line chart.

Figure 4.4: An Example of Chart showing Stock Price/Volume for 15 days

4.1.3. Company's Latest Price of Stock (Stock Quote)

Reference: <u>https://finnhub.io/docs/api/quote</u>

For Company's Latest Price, use the following API. For more details refer to Figure 4.5: https://

finnhub.io/api/v1/quote?symbol=<TICKER>&token=<API KEY>

URL parameter in API Call:

- Ticker: Ticker symbol of the stock. E.g.: MSFT
- Token: The API access Token. It is private, please do not share with anyone.

An example URL constructed from the parameters will look similar to this:

https://finnhub.io/api/v1/quote?symbol=MSFT&token=<API_KEY>

Response: We receive an array of objects, where each object contains following keys. We only need the following keys from the response.

Response Keys	Details
С	current price

d	change in price
dp	percentage change in price
h	high price of the day.
I	low price of the day.
0	open price of the day.
рс	Previous close price
t	Timestamp of last stock data

 Table 4.2: Details regarding Company's Latest Price API call.

Market Status must be open if the difference between current Timestamp (current Timestamp will be created using new Date() in javascript) and 'timestamp' key is less than 60 seconds.

1	٤
2	"c": 291.98,
3	"d": -7.52,

10	3

Figure 4.5: Response received for Company's Latest Price API call

4.1.4.Autocomplete

Reference: https://finnhub.io/docs/api/symbol-search

For Autocomplete, use the following API. For more details refer Figure 4.6:

https://finnhub.io/api/v1/search?q=<QUERY>&token=<API_KEY>

URL parameter in API Call:

- Query: Search query of stock ticker . E.g.: TSL for TSLA
- Token: The API access Token. It is private, please do not share with anyone.

An example URL constructed from the parameters will look similar like:

https://finnhub.io/api/v1/search?q=AMZ&token=<API_KEY>

Response objects:

We receive a response in the form of an array of objects. From those objects we only need the following keys:

Response Keys	Details	
count	number of results	
result	array of search result	
description	symbol description	
displaySymbol	display symbol name	
symbol	unique symbol used to identify this symbol used in /stock/candle endpoint.	
type	security type	

Table 4.3: Details regarding Autocomplete Response. API call

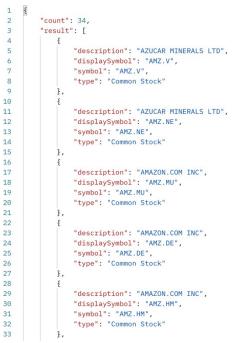

Figure 4.6: Response received for autocomplete API call

4.1.5.Company's News

Reference: https://finnhub.io/docs/api/company-news

For Company's News, use the following API. For more details refer to Figure 4.7.

https://finnhub.io/api/v1/company-news?symbol=<TICKER>&from=<DATE>&to=<DA TE>&token=<API_KEY>

URL parameter in API Call:

• Ticker: Ticker symbol of the stock. E.g.: MSFT

- to: Date in YYYY-MM-DD
- from: Date in YYYY-MM-DD
- Token: The API access Token. It is private, please do not share with anyone. See Homework 2.

An example URL constructed from the parameters will look similar to this:

https://finnhub.io/api/v1/company-news?symbol=MSFT&from=2021-09-01&to=2021-09 -09&token=<API_KEY>

Response objects:

Response Keys	Details	
category	News category	
datetime	Published timestamp in UNIX	
headline	News headline	
id	News id	
image	Thumbnail image URL	
related	Related stocks and companies mentioned	
source	News source	
summary	News summary	
url	url of original article	

Table 4.4: Details regarding Company's News API response

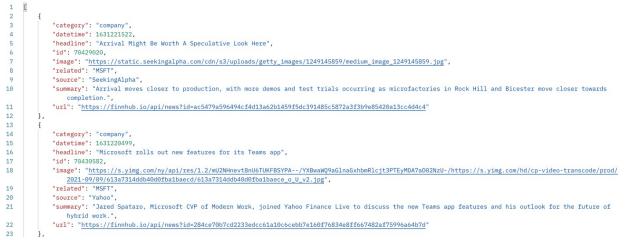

Figure 4.7: Response received for Company's News API call

4.1.6.Company's Recommendation Trends

Reference: https://finnhub.io/docs/api/recommendation-trends

For **Company's Recommendation Trends**, use the following API. For more details refer to **Figure 4.8**.

https://finnhub.io/api/v1/stock/recommendation?symbol=<TICKER>&token=<API_KE Y>

URL parameter in API Call:

- symbol: Ticker symbol of the stock., e.g., MSFT
- token: The API access Token. It is private, please do not share with anyone. See Homework 2.

An example URL constructed from the parameters will look similar to this: https://

finnhub.io/api/v1/stock/recommendation?symbol=MSFT&token=<API_KEY>

Response objects:

Response Keys	Details
Buy	Recommendation count of buy category
Hold	Recommendation count of hold category
period	Update period
sell	Recommendation count of sell category
strongBuy	Recommendation count of strongbuy category
strongSell	Recommendation count of strongsell category
Symbol	Company symbol

Table 4.5: Details regarding Company's Recommendation API call

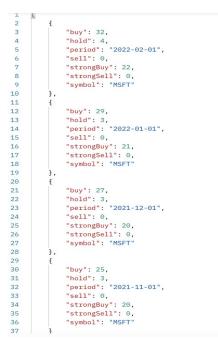

Figure 4.8: Response received for Company's Recommendation API call

4.1.7.Company's Insider Sentiment

Reference: https://finnhub.io/docs/api/insider-sentiment

For Company's Insider Sentiment, use the following API. For more details refer Figure 4.9:

https://finnhub.io/api/v1/stock/insider-sentiment?symbol=<TICKER>&from=2022-01-01 &token=<API_KEY>

NOTE: 'from=2022-01-01' should be used as a default parameter while using company's social sentiment API calls, if not used can sometime return empty response.

URL parameter in API Call:

- Ticker: Ticker symbol of the stock. E.g.: MSFT
- From: Date in YYYY-MM-DD (2022-01-01 to be used)
- Token: The API access Token. It is private, please do not share with anyone. See Homework 2.

An example URL constructed from the parameters will look similar to this: https://

finnhub.io/api/v1/stock/insider-sentiment?symbol=MSFT&token=<API_KEY>

Response Keys	Details	
data	array of entries containing month by month insider insight data	
- symbol	Ticker symbol of the stock. E.g.: MSFT	
- year	year of the data in this entry	
- month	month of the data in this entry	
- change	Net buying/selling from all insiders' transactions.	
- mspr	Monthly share purchase ratio	
symbol	Ticker symbol of the stock. E.g.: MSFT	

Response objects:

Table 4.6: Details regarding Company's Insider Sentiment API call

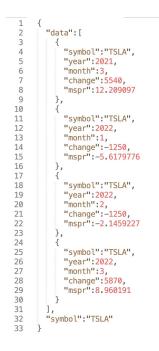

Figure 4.9: Response received for Company's Insider Sentiment API call

4.1.8.Company's Peers

Reference: https://finnhub.io/docs/api/company-peers

For Company's Peers, use the following API. For more details refer Figure 4.10: https://

finnhub.io/api/v1/stock/peers?symbol=<TICKER>&token=<API KEY>

URL parameter in API Call:

- Ticker: Ticker symbol of the stock. E.g.: MSFT
- Token: The API access Token. It is private, please do not share with anyone. See Homework 2.

An example URL constructed from the parameters will look similar to this: <u>https://</u>

finnhub.io/api/v1/stock/peers?symbol=MSFT&token=<API_KEY>

Response array:

Response Keys	Details

5. Implementation Hints

5.1.ng-bootstrap Library

To get started with the ng-bootstrap toolkit, please see: https://ng-bootstrap.github.io/#/home

ng-bootstrap will work with both Bootstrap 4 and 5, but with a specific version of Angular. Check compatibility and dependencies at:

https://ng-bootstrap.github.io/#/getting-started

Modules helpful for implementation:

Alerts - <u>https://ng-bootstrap.github.io/#/components/alert/examples</u> Modal - <u>https://ng-bootstrap.github.io/#/components/modal/examples</u>

5.2.Bootstrap UI Components

Bootstrap provides a complete mechanism to make web pages responsive for different mobile devices. In this exercise, you will get hands-on experience with responsive design using the Bootstrap Grid System.

Bootstrap 4.6 grid: <u>https://getbootstrap.com/docs/4.6/</u> layout/grid/

Bootstrap 5.2 grid: <u>https://getbootstrap.com/docs/5.2/</u> layout/grid/

Some components that are useful for implementation:

Bootstrap Cards <u>https://getbootstrap.com/docs/4.6/components/card/</u>

Bootstrap Navbar <u>https://getbootstrap.com/docs/4.6/components/navbar/</u>

5.3.Angular

- Angular Set up <u>https://</u> <u>angular.io/</u>
- Angular Material Installation <u>https://</u> material.angular.io/guide/getting-started
- Angular Material Tabs <u>https://</u> material.angular.io/components/tabs/overview
- Angular Material Spinner <u>https://material.angular.io/</u> <u>components/progress-spinner/overview</u>
- Angular Material Autocomplete <u>https://</u> material.angular.io/components/autocomplete/overview
- Angular Routing <u>https://angular.io/</u> <u>guide/routing-overview</u>

5.4.MongoDB Atlas

MongoDB Atlas is a source-available cross-platform document-oriented database program. It is classified as a NoSQL database program. MongoDB Atlas uses JSON-like documents with optional schemas. For more information, see: <u>https://www.mongodb.com/docs/</u>

MongoDB on Google Cloud: <u>https://www.mongodb.com/mongodb-on-google-cloud</u> MongoDB on AWS: <u>https://www.mongodb.com/mongodb-on-aws</u> MongoDB on Azure: <u>https://www.mongodb.com/mongodb-on-azure</u>

Once you set up an account in MongoDB Atlas, you will have to create a project to store your databases. In a project you will create a database to store collections which hold the watchlist and protfolio information data in NoSQL format. Below are the steps to set up a project and create a database.

Follow these steps create a project in which you can store databases for your application.

Q Search for a Project	university of southern california > projects Create a Project	university or southern our prone of the sources Create a Project	
Project 0	Name Your Project Add Members	Nome Your Project Add Members Add Members and Set Permissions	
	Name Your Project Project names have to be unique within the organization (and other restrictions).	Inde new or wisting users via email address	
View All Projects + New Project	Sample Project	sondeter@uscadu (you) Project Owner •	
	Cancel Next	Book Concel Create Project	
		55	

Follow these steps to create a deployment for the project by creating a cluster and providing user access and network access for the same. This would allow your application, running on a different server, to connect to MongoDB Atlas in the cloud.

or non-there actuations a lawrer project View		MongoDB. Deploy your detabase two a market wave and an advanced and polywater splitow. Thu such as all these configuration actions and the share's reveald.		Create a database user using a username and password. Users will be given the read and write to any databas privilege by default. You can update these permissions and/or areate additional users later. Ensure these aredentiatic and different to your MongoDB Cloud username and password. Username

Only an IP address you add existing IP entries via the N IP Address Enter IP Address	to your Access List will be able to etwork Access Page. Description		It Sanyla Nejest - I Con- Concolar Conc	Bit Hardwin Ale Streving Owns Image: Comparison of the compariso	
Only an IP address you add existing IP entries via the N IP Address Enter IP Address Add Entry	to your Access List will be able to etwork Access Page. Description		Bisophilogies Connoise Genomics Genomic	All Sontial Owner Contraction Contraction Contreliant	

Follow these steps to create a database and a collection in that database. MongoDB stores data records as documents (specifically in BSON format) which are gathered in collections. A database stores one or more collections of documents.

5.6 Deploy Node.js application on Cloud Services

Since this assignment is implemented with Node.js on Cloud Services, you should <u>select Nginx as your proxy server (if available)</u>, which should be the default option.

6. Files to Submit

In your course homework page on GitHub Pages, you should update the Assignment #3 link to refer to your new initial web page for this exercise. Your files must be hosted on the same service: Google Cloud, AWS or Azure. Graders will verify that this link is indeed pointing to one of the cloud services. Additionally, you need to provide an additional link to the URL of the cloud service where the AJAX call is made with sample parameter values. When this link is followed, JSON is expected as the output.

Also, submit your source code file to D2L Brightspace. Submit a single ZIP file that includes both the front-end and back-end code, plus any additional files needed to build your app. The timestamp of the ZIP file will be used to verify if you have used any "grace days."

****IMPORTANT**:**

- All explanations and clarifications provided in Piazza related to this homework are part of the homework description and grading guidelines. So please review all Piazza threads, before finishing the assignment. If there is a conflict between Piazza and this description and/or the grading guidelines, **Piazza always rules**.
- You should not call any of the Finnhub or Polygon.io APIs directly from JavaScript, bypassing the NodeJS proxy. Implementing any one of them in "client" JavaScript instead of NodeJS will result in a <u>4-point penalty.</u>
- Appearance of all views, tables, and charts should be similar to the snapshots in this document and the reference videos as much as possible.
